Ordinary And Partial Differential Equations

An ordinary differential equation (ODE) has only derivatives of one variable — that is, it has no partial derivatives. Here are a few examples of ODEs: Here are a few examples of ODEs: In contrast, a partial differential equation (PDE) has at least one partial derivative.

An ordinary differential equation is a differential equation where X is locally \mathbb{R} , while a partial differential equation is any non-ordinary differential equation. However, the main difference between locally \mathbb{R} and locally \mathbb{R}^n with $n > 1$ is that the geometry is much more

An ordinary differential equation (ODE) is an equation that involves some ordinary derivatives (as opposed to partial derivatives) of a function. Often, our goal is to solve an ODE, i.e., determine what function or functions satisfy the equation. If you know what the derivative of a function is, how can you find the function itself?

In mathematics, a partial differential equation is a differential equation that contains unknown multivariable functions and their partial derivatives. PDEs are used to formulate problems involving functions of several variables, and are either solved by hand, or used to create a computer model. A special case is ordinary differential equations, which deal with functions of a single
