The theoretical probability is 8.3% and the experimental probability is 4%. Although the experimental probability is slightly lower, this is not a significant difference. In most experiments, the theoretical probability and experimental probability will not be equal; however, they should be relatively close.

In experimental probability, the success and the failure of the concerned event are measured/counted in a selected sample and then the probability is calculated. In theoretical probability, a mathematical model is used to determine the behaviour responses to an event within the considered sample or the population. Consider a bag containing 3 ...

Unit 6 Section 4 : Theoretical and Experimental Probabilities. In this section we compare theoretical and experimental probabilities.. The term 'theoretical probabilities' describes those which have been calculated, for example by the methods described in sections 6.2. and 6.3.

Unit 6 Section 4 : Theoretical and Experimental Probabilities

I still wouldn't question what I did here when I calculated this theoretical probability. But let's say you have a lot of time on your hands. And let's say after 10,000 trials here, after 10,000 experiments, and remember the experiment; you're sticking your hand in the bag without looking, your fingers kind of feeling around, picks out a marble, and you observe the marble and you record what ...
