Generalized Theory Of Electrical Machines

The generalized theory of electrical machines is developed for a generalized machine having a number of coils with their axes located on the fixed d- and q-axes. Some machines may require fewer than 4 coils to represent them, while others may require

axis equations of the synchronous machines by making use of appropriate transformations. Park's ideas were then developed by Kron to deal with all rotating electrical machines in a systematic manner by tensor analysis. However, Gibbs et al. simplified the work of Kron by applying matrices to the electrical machines analysis.
