Meiosis Quiz . Meiosis is a two-part cell division process in organisms that sexually reproduce. In some respects, it is very similar to the process of mitosis. Meiosis is divided into two parts: meiosis I and meiosis II. At the end of the meiotic process, there are four daughter cells rather than the two produced at the end of the mitotic process.

The similarities between mitosis and meiosis are as follows: Mitosis and meiosis take place in the cell nuclei. Both involve cell division. Both the processes occur in the M-phase of the cell cycle. In both cycles, the stages are common – metaphase, anaphase, telophase and prophase. Synthesis of DNA occurs in both.

Mitosis: The process cells use to make exact replicas of themselves. Mitosis is observed in almost all the body’s cells, including eyes, skin, hair, and muscle cells. Meiosis: In this type of cell division, sperm or egg cells are produced instead of identical daughter cells as in mitosis.

Diploid Cell (2N): From a preceding mitotic division, the Oogonium (Spermatogonium) enters meiosis with DIPLOID (2N) chromosomes but TETRAPLOID (4N) DNA. Chromosomes then duplicate to produce SISTER CHROMATIDS (or HOMOLOGOUS DYADS). Prophase I: Dyad pairs align to create "TETRADS", non-sister chromatids connect and trade sections at a "CHIASMA", a process called "CROSSING OVER".

S Phase: To produce two similar daughter cells, the complete DNA instructions in the cell must be duplicated. DNA replication occurs during this S (synthesis) phase. Gap 2 (G2): During the gap between DNA synthesis and mitosis, the cell will continue to grow and produce new proteins. At the end of this gap is another control checkpoint (G2 Checkpoint) to determine if the cell can now proceed to ...
