Sickle cell disease is an inherited form of anemia where red blood cells become abnormally long and pointed, similar to the shape of a banana. It affects approximately 100,000 people in the United States and millions worldwide. In the U.S. it occurs in about one out of every 365 African-American births and more rarely in Hispanic-American births

10 Statistics and Facts on Sickle Cell Disease

Two important words could be added to the title of this well-researched and very instructive book, for Edelstein's actual thesis is The sickled cell: from myths through evolution to molecules. This brilliant author appears to be using the haemoglobin molecule not only to establish that Darwinian evolution has taken place but also to show that evolution is the only way to explain sickle cells.
